1 Overview of the functionality

This app provides the “Microsoft Graph E-Mail Import” object and thereby enables the import of e-mails to Fabasoft Approve using the Microsoft Graph API.

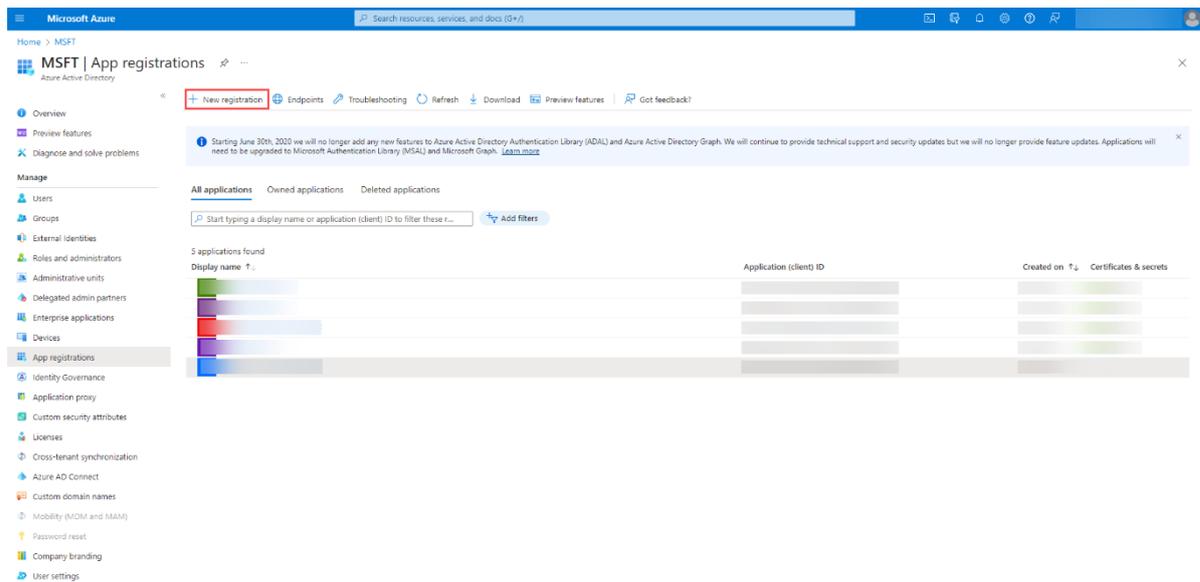

2 General procedure

In this chapter, the general procedure is explained in a concise way to get an overview. The subsequent chapters explain the steps in more detail.

- Registration of application in Active Directory (AD)
- Creation of Microsoft Graph E-Mail Import object

3 Registration of an application in AD

In order to use the Microsoft Graph Toolkit an application has to be registered inside the AD. This application enables the access to resources via OAuth. The registration of an application can be accomplished by clicking the “New registration” button as shown in the following illustration.

Thereafter a name for the application along with some additional information has to be provided (see the illustration below). For the “Supported account types” the option “Accounts in this organizational directory only (MSFT only - Single tenant)” has to be checked. Moreover, a “Redirect URI (optional)” has to be specified. In the dropdown menu “Web” has to be selected. The

authentication response will be returned to this URI, which has to have the format shown in the following illustration.

Microsoft Azure | Search resources, services, and docs (G+)

Home > MSFT | App registrations >

Register an application

* Name
The user-facing display name for this application (this can be changed later).
Test application

Supported account types

Who can use this application or access this API?

- Accounts in this organizational directory only (MSFT only - Single tenant)
- Accounts in any organizational directory (Any Microsoft Entra ID tenant - Multitenant)
- Accounts in any organizational directory (Any Microsoft Entra ID tenant - Multitenant) and personal Microsoft accounts (e.g. Skype, Xbox)
- Personal Microsoft accounts only

Help me choose...

Redirect URI (optional)
We'll return the authentication response to this URI after successfully authenticating the user. Providing this now is optional and it can be changed later, but a value is required for most authentication scenarios.

Web | e.g. https://example.com/auth

Register an app you're working on here. Integrate gallery apps and other apps from outside your organization by adding from [Enterprise applications](#).

By proceeding, you agree to the [Microsoft Platform Policies](#)

Register

If the registration is completed with the marked "Register" button, the application will appear in the list shown in the beginning. After the registration of the application, a Client Secret has to be generated. This can be achieved when selecting the application following the marked steps:

Microsoft Azure | Search resources, services, and docs (G+)

Home > MSFT | App registrations > Test application

Test application | Certificates & secrets

Overview | Quickstart | Integration assistant

Manage

- Branding & properties
- Authentication
- Certificates & secrets** 1
- Token configuration
- API permissions
- Expose an API
- App roles
- Owners
- Roles and administrators
- Manifest

Support + Troubleshooting

- Troubleshooting
- New support request

Credentials enable confidential applications to identify themselves to the authentication service when receiving tokens at a web addressable location (using an HTTPS scheme). For a higher level of assurance, we recommend using a certificate (instead of a client secret) as a credential.

Application registration certificates, secrets and federated credentials can be found in the tabs below.

Certificates (0) | **Client secrets (1)** | Federated credentials (0)

A secret string that the application uses to prove its identity when requesting a token. Also can be referred to as application password.

+ New client secret 2

Description	Expires	Value	Secret ID
-------------	---------	-------	-----------

Add client secret

Description 3 | Secret for IAM Connection

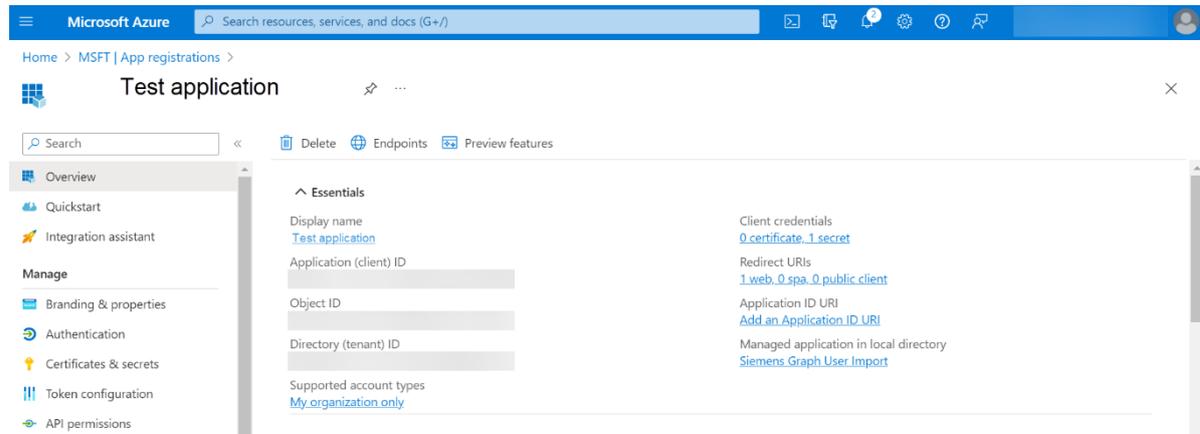

Expires 4 | Recommended: 180 days (6 months)

5

Add | Cancel

After the creation of the Client Secret, it will appear in the list of Client Secrets. In this view the value of the Client Secret can be found, which will be needed later in this example. The necessary

information about the application can be viewed under the menu item "Overview" as shown in the following illustration:

For further information on creating an AD application, consider to follow the following link: [Create an AD application to use with the Microsoft Graph Toolkit](#)

4 Microsoft Graph E-Mail Import Object

In the next step, a "Microsoft Graph E-Mail Import" object has to be created. This object enables the import of e-mails from Microsoft Azure Active Directory (AD) to Fabasoft Approve using the Microsoft Graph API.

4.1 Properties

The following fields are available for Microsoft Graph E-Mail Import Objects:

- **Name**
The name of the "Microsoft Graph E-Mail Import" object is entered here, which is solely for descriptive purposes.
- **Client ID**
The "Application (client) ID" shown in the "Overview" tab inside the AD has to be entered here. This is the unique identifier of the previously generated application and is needed to authenticate with AD.
- **Client Secret**
This is the secret application key and can be created during the registration of application in AD. It is a secret string used by the application to request an OAuth-token. It is often also referred as "application password". The value (not the ID) of the Client Secret has to be entered in this input field.
- **Account Type**
In this field you have to select the account type. In most enterprise scenarios this will be "Organizations Only".
- **Mailbox Type**
In this field you have to select the mailbox type, either "Personal Mailbox" or "Shared Mailbox".
- **E-Mail Folder**
In this field you can specify the name of the e-mail folder to import e-mails from. If left undefined, e-mails will be imported from the e-mail folder "Inbox".

- *Target Folder*
In this field you have to select the target folder where the imported e-mails will be created.
- *Target List*
In this field you have to select the list of the target folder where to store the imported e-mails.
- *Enable Check for Duplicate E-Mails*
If enabled, a check for duplicate e-mails will be performed based on the “Internet Message ID” (IMID) of the processed e-mails. A list with the IMIDs of the e-mails already processed is kept in the background and a new e-mail is only imported if its IMID is not yet in the list. For performance reasons, it is advisable to periodically clean up the e-mail folder from which e-mails are imported by removing or moving e-mails that have already been processed and then executing the “Reset Synchronization State” and “Reset List of Processed E-Mail Message IDs” use cases.
- *Fetch Interval*
In this field the time interval for the automated import of e-mails in the background can be set. The following intervals are available:
 - 5 Minutes
 - 15 Minutes
 - 30 Minutes
 - 1 Hour
 - 12 Hours
 - 1 Day
- *Expression for Filtering E-Mails*
This expression is executed on the Microsoft Graph Mail Import object that triggered the e-mail import. If the expression is specified and returns false, the e-mail is ignored and not processed any further. If the expression is not specified or returns null or true, the e-mail is imported.
- *Expression for Initializing Imported E-Mails*
This expression is executed on the Microsoft Graph Mail Import object that triggered the e-mail import and can be used for the initialization of an imported e-mail. The result of the expression is ignored.
- *E-Mail Address for Error Notifications*
If an e-mail address is specified in this field, an e-mail containing additional information about the cause of the error will be sent to this address in the event of an error when importing e-mails.
- *Ignore E-Mail Retrieval Errors*
If this field enabled, any errors encountered during the e-mail import will be ignored.

4.2 Actions

The following actions are available for the Microsoft Graph E-Mail Import Object:

4.2.1 Manual Import

In order to trigger the e-mail import manually, select "Import Now" from the context menu or task pane of the "Microsoft Graph E-Mail Import" object.

4.2.2 (Re-)Authenticate

The "(Re-)Authenticate" use case is only visible when the Client ID and the Client Secret of the in the "Microsoft Graph E-Mail Import" object is set. When executing this use case, the authentication process is started. As a result of this action a new user consent is received. Before the first e-mail import, this use case needs to be executed and an authorized user has to grant the application the requested permissions to read and retrieve e-mail folders and e-mails from AD.

4.2.3 Reset Synchronization State

This use case allows you to reset the synchronization state retrieved from AD. If you reset the synchronization state, all e-mails in the specified e-mail folder will be processed again during the next import operation.

4.2.4 Reset List of Processed E-Mail Message IDs

If the field *Enable Check for Duplicate E-Mails* is enabled, a list of the "Internet Message ID" (IMID) of the e-mails already processed is kept in the background and a new e-mail is only imported if its IMID is not yet in the list. For performance reasons, it is advisable to periodically clean up the e-mail folder from which e-mails are imported by removing or moving e-mails that have already been processed and then executing the "Reset Synchronization State" and "Reset List of Processed E-Mail Message IDs" use cases.
